Max-cut SDP

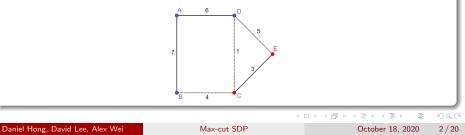

Max-cut Problem

Cut

Consider a graph G = (V, E) with vertex set V = [n] and fixed weights $\{w_{ij}\}_{ij \in E}$ assigned to the edges. A *cut* is a partition of the vertex set $V = V_1 \sqcup V_2$.

Example

This partitions the graph into $\{C,\,E\}$ and $\{A,\,B,\,D\},$ cutting across edges with a total sum of 10.

Max-cut Problem

The max-cut problem asks to split the vertex set of a graph into two groups to maximize the sum of edge weights between the two groups. In other words, we wish to find the maximum possible value of a cut $V_1 \sqcup V_2$.

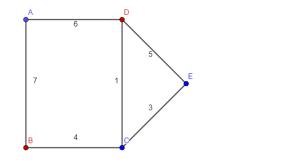

Applications

Applications of the max-cut problem:

- Theoretical/Statistical physics
- Circuit design

Max-cut Problem

Example

Above shows the max cut possible for this graph; it has a value of 23.

Daniel I	Hong,	David	Lee,	Alex	Wei	
----------	-------	-------	------	------	-----	--

Properties of max-cut problem

- The max-cut problem is *NP-complete*.
- However, the problem can be approximated in polynomial time up to a factor of 0.87854.
- This uses a technique known as *semidefinite programming* (SDP).

Representing Graphs

Laplacian Matrix

Consider a graph G = (V, E) with vertex set $V = [n] = \{1, 2, ..., n\}$ and weights w. We define the Laplacian matrix L(G, w) as the $n \times n$ matrix with entries

$$L(G, w)_{ij} := \begin{cases} -w_{ij} & \text{if } ij \in E \\ \sum_k w_{ik} & \text{if } i = j \\ 0 & \text{otherwise.} \end{cases}$$

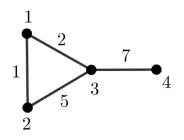

(I) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1))

Representing Graphs

Example

The Laplacian matrix of the graph below is

$$\begin{bmatrix} \mathbf{3} & -1 & -2 & 0 \\ -1 & \mathbf{6} & -5 & 0 \\ -2 & -5 & \mathbf{14} & -7 \\ 0 & 0 & -7 & \mathbf{7} \end{bmatrix}$$

PSD Matrices and Semidefinite programming

Positive Semidefinite Matrices

A *d*-by-*d* symmetric matrix *M* is *positive semidefinite* (PSD), or $M \succeq 0$, if and only if there exists a square root matrix *B* such that $B^T B = M$.

PSD Matrices and Semidefinite programming

Positive Semidefinite Matrices

A *d*-by-*d* symmetric matrix *M* is *positive semidefinite* (PSD), or $M \succeq 0$, if and only if there exists a square root matrix *B* such that $B^T B = M$.

Frobenius Inner Product

• represents the Frobenius inner product, which is the entry-wise product summed over all entries.

$$\begin{bmatrix} 2 & 2 \\ 0 & 3 \end{bmatrix} \bullet \begin{bmatrix} -1 & 0 \\ 2 & 1 \end{bmatrix} = (2)(-1) + (2)(0) + (0)(2) + (3)(1) = 1.$$

Semidefinite Programs

Semidefinite Program

Let C be a $n \times n$ cost matrix. Consider m constraint matrices $A_1, A_2, \ldots, A_m \in \mathbb{S}^n$, as well as a constraint vector $b \in \mathbb{R}^m$. A semidefinite program is an optimization problem of the form

$$\begin{array}{ll} \max_{X \in \mathbb{S}^n} & C \bullet X \\ \text{s.t.} & A_i \bullet X = b_i \quad \forall 1 \le i \le m \\ & X \succeq 0 \end{array}$$

Note that this optimization is *linear* in the entries of X. In fact, there are known algorithms to solve it in polynomial time.

< □ > < □ > < □ > < □ > < □ > < □ >

Example of an SDP

Example

$$\max_{X \in \mathbb{S}^n} X \bullet \begin{bmatrix} 1 & 8 \\ 8 & -1 \end{bmatrix}$$

s.t.
$$X \bullet \begin{bmatrix} 1 & 0 \\ 0 & 0 \end{bmatrix} = 1$$
$$X \succeq 0.$$

Given $X = \begin{bmatrix} z & y \\ y & x \end{bmatrix}$, the constraints become z = 1 and $x \ge y^2$, and we must maximize 1 + 16y - x. The maximum is 65.

Primal max-cut SDP

The following is the SDP relaxation of the max-cut problem:

$$\begin{array}{ll} \max_{X \in \mathbb{S}^n} & \frac{1}{4}L(G,w) \bullet X \\ \text{s.t.} & X_{ii} = 1 \text{ for } i \in [n] \\ & X \succeq 0. \end{array}$$

We denote the optimal primal solution by \bar{X} .

• • • • • • • • • • • • •

Dual max-cut SDP

The following is the dual of the primal max-cut SDP:

We similarly denote the dual optimal solution by \overline{S} .

Rank of Max-cut SDP

Primal max-cut SDP

$$\begin{array}{ll} \max_{X \in \mathbb{S}^n} & \frac{1}{4}L(G, w) \bullet X \\ \text{s.t.} & X_{ii} = 1 \text{ for } i \in [n] \\ & X \succeq 0. \end{array}$$

- When we write the max-cut problem algebraically, a vector x ∈ ℝⁿ represents a cut, and we write X = xx^T.
- The condition $X = xx^T \iff \operatorname{rank} X = 1$. Furthermore, all symmetric rank-1 matrices are positive semidefinite.
- All rank-1 primal optimal solutions to the SDP must be exact solutions to the max-cut problem.

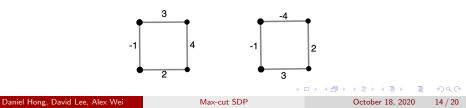

< ロ > < 同 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ >

Rank-1 solutions for cycles

Theorem (Rank 1 solutions of cycles)

The cycle graph exhibits a rank 1 solution if and only if at least one of the following holds:

- There are an even number of positively weighted edges
- Take the list of the absolute values of the reciprocal of every edge weight (with repetition). Then there is a value in this list that is at least the sum of the rest.
- Rank 1 solutions: $\{-4, 2, 3, -1\}, \{-2, -3, 8\}.$
- Rank 2 solutions: $\{4, 2, 3, -1\}, \{-2, -3, 5\}.$

Max-Cut Problem on cycles

- Ideally, the cut of a graph should split the edges with positive weights and not split those with negative weights.
- Using this, we can attempt to do this for every edge. From this, we can solve for the best solution for the max-cut SDP.

< □ > < □ > < □ > < □ > < □ > < □ >

This theorem is presented without proof:

Theorem (Primal-dual feasibility for optimal solutions)

Let matrices \bar{X} and \bar{S} be optimal primal and dual matrices for the max-cut problem on a graph G, respectively. Then $\bar{X}\bar{S} = 0$ (all entries are 0).

This theorem tells us that every column of \overline{S} is in the nullspace of every column of \overline{X} . Since \overline{S} is known on all off-diagonal values, given a \overline{X} , one can find all entries of \overline{S} (and \overline{S} is thus unique).

Identifying rank 1 solutions using \bar{S}

Theorem (Rank 1 solutions of cycles)

The cycle graph exhibits a rank 1 solution if and only if at least one of the following holds:

- There are an even number of positively weighted edges
- Take the list of the absolute values of the reciprocal of every edge weight (with repetition). Then there is a value in this list that is at least the sum of the rest.

Identifying rank 1 solutions using \bar{S}

Theorem (Rank 1 solutions of cycles)

The cycle graph exhibits a rank 1 solution if and only if at least one of the following holds:

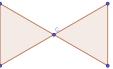

- There are an even number of positively weighted edges
- Take the list of the absolute values of the reciprocal of every edge weight (with repetition). Then there is a value in this list that is at least the sum of the rest.
- Identify possible rank 1 primal optimal matrix solutions to the max-cut problem
- Identify possible dual matrices resulting from these primal matrices
- Impose the positive semi-definite constraint.

Ranks and Solutions for Clique Sums

We provide two examples of clique sums for illustration.

The butterfly graph below is the *vertex sum* of two K_3 graphs joined at vertex C.

The diamond graph below is the *edge sum* of two K_3 graphs joined at edge AB.

Ranks and Solutions for Clique Sums

Given two graphs and optimal solutions to their max-cut SDP, we show that we can *find an optimal solution* to the max-cut SDP of their *vertex sum*.

Given two K_3 graphs, we can find an optimal solution given certain conditions on the weights in terms of the optimal solutions of the K_3 graphs' SDPs.

Future work:

- General result for edge sums
- Extension to more families of graphs
