If one parameter in a problem is known to be small, we can write the solution as a **Taylor expansion** in that parameter, and drop high-degree terms.

Example (Hinch)

Solve $x^2 - \varepsilon x - 1 = 0$ for the positive solution.

Expanding $x = x_0 + \varepsilon x_1 + \varepsilon^2 x_2 + \dots$ yields

$$x_0^2 - 1 + \varepsilon(2x_0x_1 - x_0) + \varepsilon^2(2x_0x_2 + x_1^2 - x_1) + \dots = 0.$$

Setting each coefficient to 0, and solve the resulting equations.

Then $x = 1 + \frac{1}{2}\varepsilon + \frac{1}{8}\varepsilon^2 + \dots$, agreeing with $\frac{1}{2}\varepsilon + \sqrt{1 + \frac{1}{4}\varepsilon}$.

Example (Hughes)

Find the solution u to $u'' = -f$ on $[0, 1]$ where $u(0) = u(1) = 0$.

In this problem, $u'' + f = 0$ is the **field equation** and $u(0) = u(1) = 0$ is the **boundary condition**.

Equivalently, $\int u'' w + f w \, dx = 0$ for all w . We call w the **test function**.

If $w(0) = w(1) = 0$, integrating by parts yields the **weak form**

$$\int f w \, dx = \int u' w' \, dx.$$

Finite Element Method 2

Restrict w and u to piecewise linear functions.

Using ϕ_i to denote **basis functions**, $u = \sum_i u_i \phi_i$ and $w = \sum_i w_i \phi_i$.

Finite Element Method 2

Restrict w and u to piecewise linear functions.

Then the coefficients u_j form a vector.

Recall

$$\int f w \, dx = \int u' w' \, dx.$$

If u satisfies this equation for w equalling each basis function ϕ_i then u is a solution.

$$\forall i, \int f \phi_i \, dx = \sum_j u_j \left(\int \phi_j' \phi_i' \, dx \right).$$

This now becomes a **linear matrix problem**.

We will use the expansion

$$\vec{u} = \varepsilon_1 e^{it} (\hat{u}_0 + \varepsilon_2 \hat{u}_1) + \varepsilon_1^2 (\bar{u}_0 + \varepsilon_2 \bar{u}_1).$$

- 1 Solving for time-independent velocity fields $\hat{u}_0, \hat{u}_1, \bar{u}_0, \bar{u}_1$.
- 2 At order ε_1 the velocity is driven by oscillation, necessitating the e^{it} term.
- 3 At order ε_1^2 the velocity self-interferes, creating a steady flow.
- 4 We have additional expansions in ε_2 at both orders to examine the contribution from eccentricity.
