February 4, 2020, *Open problems addressable by atlas: unitarity.*

<https://zoom.us/s/739477128>.

The central problem that **atlas** is designed to address is the classification of unitary representations. One aspect of that is looking at a single representation and deciding whether it is unitary; a lot of the fall semester sessions were about that. Today I'll start looking at how to assemble such individual answers into a finite description of *all* unitary representations.
