Sato-Tate in dimension 1

Let $E/\mathbb{Q}$ be an elliptic curve, which we can write in the form

$$y^2 = x^3 + ax + b,$$

and let p be a prime of good reduction ($4a^3 + 27b^2 \not\equiv 0 \bmod p$).

The number of $\mathbb{F}_p$-points on the reduction E_p of E modulo p is

$$\#E_p(\mathbb{F}_p) = p + 1 - t_p,$$

where the trace of Frobenius t_p is an integer in $[-2\sqrt{p}, 2\sqrt{p}]$.

We are interested in the limiting distribution of $x_p = -t_p/\sqrt{p} \in [-2, 2]$, as p varies over primes of good reduction up to N, as $N \to \infty$.

Example: $y^2 = x^3 + x + 1$

Sato-Tate distributions in dimension 1

1. Typical case (no CM)

Elliptic curves $E/\mathbb{Q}$ w/o CM have the semi-circular trace distribution. (This is also known for E/k, where k is a totally real number field).

[Taylor et al.]

2. Exceptional cases (CM)

Elliptic curves E/k with CM have one of two distinct trace distributions, depending on whether k contains the CM field or not.

[classical (Hecke, Deuring)]

Sato-Tate groups in dimension 1

The *Sato-Tate group* of E is a closed subgroup G of $\mathrm{SU}(2) = \mathrm{USp}(2)$ derived from the ℓ-adic Galois representation attached to E.

The refined Sato-Tate conjecture implies that the distribution of normalized traces of E_p converges to the distribution of traces in the Sato-Tate group of G, under the Haar measure.

G	G/G^0	E	k	$\mathrm{E}[a_1^0], \mathrm{E}[a_1^2], \mathrm{E}[a_1^4] \ldots$
$\mathrm{U}(1)$	C_1	$y^2 = x^3 + 1$	$\mathbb{Q}(\sqrt{-3})$	$1, 2, 6, 20, 70, 252, \ldots$
$N(\mathrm{U}(1))$	C_2	$y^2 = x^3 + 1$	$\mathbb{Q}$	$1, 1, 3, 10, 35, 126, \ldots$
$\mathrm{SU}(2)$	C_1	$y^2 = x^3 + x + 1$	$\mathbb{Q}$	$1, 1, 2, 5, 14, 42, \ldots$

In dimension 1 there are three possible Sato-Tate groups, two of which arise for elliptic curves defined over $\mathbb{Q}$.

Zeta functions and L-polynomials

For a smooth projective curve $C/\mathbb{Q}$ of genus g and each prime p of good redution for C we have the *zeta function*

$$Z(C_p/\mathbb{F}_p;T) := \exp\left(\sum_{k=1}^{\infty} N_k T^k/k\right),$$

where $N_k = \#C_p(\mathbb{F}_{p^k})$. This is a rational function of the form

$$Z(C_p/\mathbb{F}_p;T) = \frac{L_p(T)}{(1-T)(1-pT)},$$

where $L_p(T)$ is an integer polynomial of degree $2g$.

For $g=1$ we have $L_p(t) = pT^2 + c_1T + 1$, and for $g=2$,

$$L_p(T) = p^2T^4 + c_1pT^3 + c_2T^2 + c_1T + 1.$$

Normalized L-polynomials

The normalized polynomial

$$\bar{L}_p(T) := L_p(T/\sqrt{p}) = \sum_{i=0}^{2g} a_i T^i \in \mathbb{R}[T]$$

is monic, reciprocal ($a_i = a_{2g-i}$), and unitary (roots on the unit circle). The coefficients a_i necessarily satisfy $|a_i| \le \binom{2g}{i}$.

We now consider the limiting distribution of $a_1, a_2, \ldots, a_g$ over all primes $p \le N$ of good reduction, as $N \to \infty$.

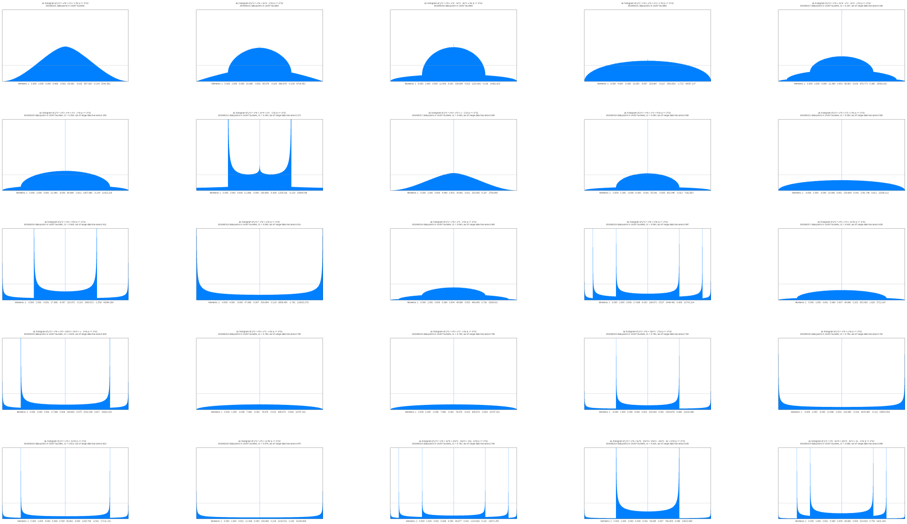
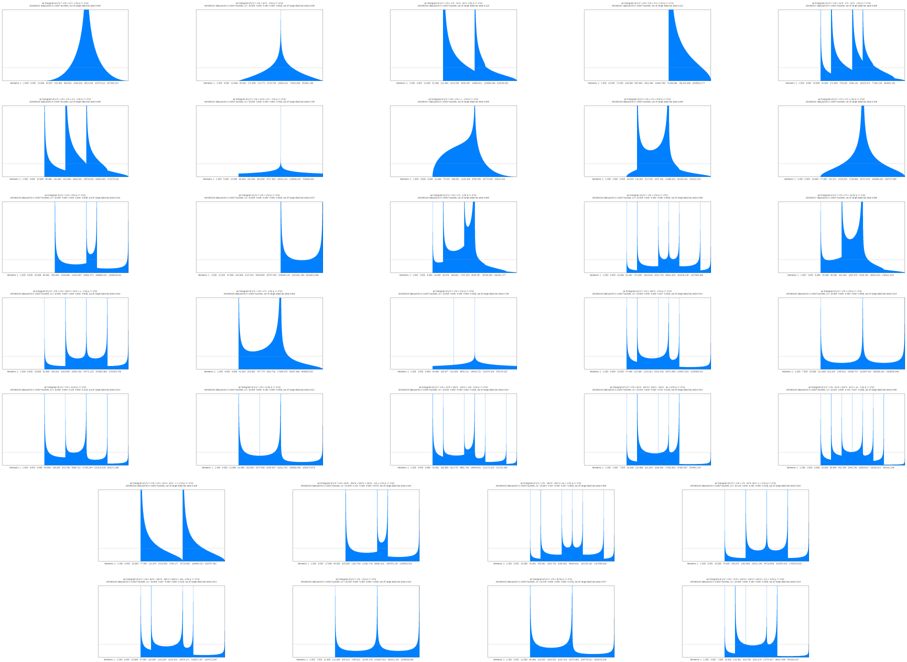
Exceptional distributions for abelian surfaces over $\mathbb{Q}$:





L-polynomials of Abelian varieties

Let A be an abelian variety of dimension $g \geq 1$ over a number field k and fix a prime ℓ.

Let $\rho_\ell \colon G_k \to \mathrm{Aut}_{\mathbb{Q}_\ell}(V_\ell(A)) \simeq \mathrm{GSp}_{2g}(\mathbb{Q}_\ell)$ be the Galois representation arising from the action of $G_k := \mathrm{Gal}(\bar{k}/k)$ on the ℓ-adic Tate module

$$V_\ell(A) := \varprojlim A[\ell^n] \otimes \mathbb{Q}.$$

For each prime $\mathfrak{p}$ of good reduction for A we have the *L-polynomial*

$$L_\mathfrak{p}(T) := \det(1 - \rho_\ell(\mathrm{Frob}_\mathfrak{p})T),$$
$$\bar{L}_\mathfrak{p}(T) := L_\mathfrak{p}(T/\sqrt{\|\mathfrak{p}\|}) = \sum a_i T^i.$$

In the case that A is the Jacobian of a genus g curve C, this agrees with our earlier definition of $L_\mathfrak{p}(T)$ as the numerator of the zeta function of C.

The Sato-Tate problem for an abelian variety

The polynomials $\bar{L}_{\mathfrak{p}} \in \mathbb{R}[T]$ are monic, symmetric, unitary, and have degree $2g$.

Every such polynomial arises as the characteristic polynomial of a conjugacy class in the unitary symplectic group $\mathrm{USp}(2g)$.

Each probability measure on $\mathrm{USp}(2g)$ determines a distribution of conjugacy classes (hence a distribution of characteristic polynomials).

The *Sato-Tate problem*, in its simplest form, is to find a measure for which these classes are equidistributed.

Conjecturally, such a measure arises as the Haar measure of a compact subgroup ST_A of $\mathrm{USp}(2g)$.

The Sato-Tate group

Recall that the action of G_k on $V_\ell(A)$ induces the representation

$$\rho_\ell\colon G_k \to \mathrm{Aut}_{\mathbb{Q}_\ell}(V_\ell(A)) \simeq \mathrm{GSp}_{2g}(\mathbb{Q}_\ell).$$

Fixing an embedding $\iota\colon \mathbb{Q}_\ell \hookrightarrow \mathbb{C}$, we now apply

$$\ker(G_k \xrightarrow{\chi_\ell} \mathbb{Q}_\ell^\times) \xrightarrow{\overline{\rho_\ell}} \mathrm{Sp}_{2g}(\mathbb{Q}_\ell) \xrightarrow{\otimes_\iota \mathbb{C}} \mathrm{Sp}_{2g}(\mathbb{C}),$$

and define ST_A to be a maximal compact subgroup of the image.

Conjecturally, ST_A does not depend on ℓ or ι; this is known for $g \le 3$.

Definition [Serre]

$\mathrm{ST}_A \subseteq \mathrm{USp}(2g)$ is the *Sato-Tate group* of A.

The refined Sato-Tate conjecture

Let $s(\mathfrak{p})$ denote the conjugacy class of $\rho_\ell(\mathrm{Frob}_\mathfrak{p})^{\mathrm{ss}}/\sqrt{\|\mathfrak{p}\|} \in \mathrm{ST}_A$.

Let μ_{ST_A} denote the image of the Haar measure on $\mathrm{Conj}(\mathrm{ST}_A)$, which does not depend on the choice of ℓ or ι.

Conjecture

The conjugacy classes $s(\mathfrak{p})$ are equidistributed with respect to μ_{ST_A}.

In particular, the distribution of $\bar{L}_\mathfrak{p}(T)$ matches the distribution of characteristic polynomials of random matrices in ST_A.

We can test this numerically by comparing statistics of the coefficients $a_1, \ldots, a_g$ of $\bar{L}_\mathfrak{p}(T)$ over $\|\mathfrak{p}\| \le N$ to the predictions given by μ_{ST_A}.

`https://hensel.mit.edu:8000/home/pub/5`

The Sato-Tate axioms

The Sato-Tate axioms for abelian varieties (weight-1 motives):

1. G is closed subgroup of $\mathrm{USp}(2g)$.
2. **Hodge condition**: G contains a Hodge circle[1] whose conjugates generate a dense subset of G.
3. **Rationality condition**: for each component H of G and each irreducible character χ of $\mathrm{GL}_{2g}(\mathbb{C})$ we have $\mathrm{E}[\chi(\gamma) : \gamma \in H] \in \mathbb{Z}$.

For any fixed g, the set of subgroups $G \subseteq \mathrm{USp}(2g)$ that satisfy the *Sato-Tate axioms* is **finite** up to conjugacy (3 for $g = 1$, 55 for $g = 2$).

[1] An embedding $\theta\colon \mathrm{U}(1) \to G^0$ where $\theta(u)$ has eigenvalues u and u^{-1} each with multiplicity g.

The Sato-Tate axioms

The Sato-Tate axioms for abelian varieties (weight-1 motives):

1. G is closed subgroup of $\mathrm{USp}(2g)$.
2. **Hodge condition**: G contains a Hodge circle[1] whose conjugates generate a dense subset of G.
3. **Rationality condition**: for each component H of G and each irreducible character χ of $\mathrm{GL}_{2g}(\mathbb{C})$ we have $\mathrm{E}[\chi(\gamma) : \gamma \in H] \in \mathbb{Z}$.

For any fixed g, the set of subgroups $G \subseteq \mathrm{USp}(2g)$ that satisfy the *Sato-Tate axioms* is **finite** up to conjugacy (3 for $g = 1$, 55 for $g = 2$).

Theorem

For $g \leq 3$, the group ST_A satisfies the Sato-Tate axioms.

This is expected to hold for all g.

[1] An embedding $\theta\colon \mathrm{U}(1) \to G^0$ where $\theta(u)$ has eigenvalues u and u^{-1} each with multiplicity g.

Galois types

Let A be an abelian variety defined over a number field k.
Let K be the minimal extension of k for which $\mathrm{End}(A_K) = \mathrm{End}(A_{\bar{\mathbb{Q}}})$.
$\mathrm{Gal}(K/k)$ acts on the $\mathbb{R}$-algebra $\mathrm{End}(A_K)_{\mathbb{R}} = \mathrm{End}(A_K) \otimes_{\mathbb{Z}} \mathbb{R}$.

Definition

The *Galois type* of A is the isomorphism class of $[\mathrm{Gal}(K/k), \mathrm{End}(A_K)_{\mathbb{R}}]$, where $[G, E] \simeq [G', E']$ iff there are isomorphisms $G \simeq G'$ and $E \simeq E'$ that are compatible with the Galois action.

Galois types

Let A be an abelian variety defined over a number field k.
Let K be the minimal extension of k for which $\mathrm{End}(A_K) = \mathrm{End}(A_{\bar{\mathbb{Q}}})$.
$\mathrm{Gal}(K/k)$ acts on the $\mathbb{R}$-algebra $\mathrm{End}(A_K)_{\mathbb{R}} = \mathrm{End}(A_K) \otimes_{\mathbb{Z}} \mathbb{R}$.

Definition

The *Galois type* of A is the isomorphism class of $[\mathrm{Gal}(K/k), \mathrm{End}(A_K)_{\mathbb{R}}]$, where $[G, E] \simeq [G', E']$ iff there are isomorphisms $G \simeq G'$ and $E \simeq E'$ that are compatible with the Galois action.

Theorem [FKRS 2012]

For abelian varieties A/k of dimension $g \leq 3$ there is a one-to-one correspondence between Sato-Tate groups and Galois types.

More precisely, the identity component G^0 is uniquely determined by $\mathrm{End}(A_k)_{\mathbb{R}}$ and $G/G^0 \simeq \mathrm{Gal}(K/k)$ (with corresponding actions).

Real endomorphism algebras of abelian surfaces

generic abelian surface	$\mathbb{R}$	$\mathrm{USp}(4)$

(factors in products are assumed to be non-isogenous)

Sato-Tate groups in dimension 2

Theorem [FKRS 2012]

Up to conjugacy, 55 subgroups of $\mathrm{USp}(4)$ satisfy the Sato-Tate axioms:

$$\begin{array}{rl}
\mathrm{U}(1)_2: & C_1, C_2, C_3, C_4, C_6, D_2, D_3, D_4, D_6, T, O, \\
& J(C_1), J(C_2), J(C_3), J(C_4), J(C_6), \\
& J(D_2), J(D_3), J(D_4), J(D_6), J(T), J(O), \\
& C_{2,1}, C_{4,1}, C_{6,1}, D_{2,1}, D_{3,2}, D_{4,1}, D_{4,2}, D_{6,1}, D_{6,2}, O_1 \\
\mathrm{SU}(2)_2: & E_1, E_2, E_3, E_4, E_6, J(E_1), J(E_2), J(E_3), J(E_4), J(E_6) \\
\mathrm{U}(1)\times\mathrm{U}(1): & F, F_a, F_c, F_{a,b}, F_{ab}, F_{ac}, F_{ab,c}, F_{a,b,c} \\
\mathrm{U}(1)\times\mathrm{SU}(2): & \mathrm{U}(1)\times\mathrm{SU}(2),\ N(\mathrm{U}(1)\times\mathrm{SU}(2)) \\
\mathrm{SU}(2)\times\mathrm{SU}(2): & \mathrm{SU}(2)\times\mathrm{SU}(2),\ N(\mathrm{SU}(2)\times\mathrm{SU}(2)) \\
\mathrm{USp}(4): & \mathrm{USp}(4)
\end{array}$$

Sato-Tate groups in dimension 2

Theorem [FKRS 2012]

Up to conjugacy, 55 subgroups of $\mathrm{USp}(4)$ satisfy the Sato-Tate axioms:

$$\begin{aligned}
\mathrm{U}(1): \quad & C_1, C_2, C_3, C_4, C_6, D_2, D_3, D_4, D_6, T, O,\\
& J(C_1), J(C_2), J(C_3), J(C_4), J(C_6),\\
& J(D_2), J(D_3), J(D_4), J(D_6), J(T), J(O),\\
& C_{2,1}, C_{4,1}, C_{6,1}, D_{2,1}, D_{3,2}, D_{4,1}, D_{4,2}, D_{6,1}, D_{6,2}, O_1\\
\mathrm{SU}(2): \quad & E_1, E_2, E_3, E_4, E_6, J(E_1), J(E_2), J(E_3), J(E_4), J(E_6)\\
\mathrm{U}(1)\times\mathrm{U}(1): \quad & F, F_a, F_c, F_{a,b}, F_{ab}, F_{ac}, F_{ab,c}, F_{a,b,c}\\
\mathrm{U}(1)\times\mathrm{SU}(2): \quad & \mathrm{U}(1)\times\mathrm{SU}(2),\ N(\mathrm{U}(1)\times\mathrm{SU}(2))\\
\mathrm{SU}(2)\times\mathrm{SU}(2): \quad & \mathrm{SU}(2)\times\mathrm{SU}(2),\ N(\mathrm{SU}(2)\times\mathrm{SU}(2))\\
\mathrm{USp}(4): \quad & \mathrm{USp}(4)
\end{aligned}$$

Of these, exactly 52 arise as ST_A for an abelian surface A (34 over $\mathbb{Q}$).

Sato-Tate groups in dimension 2

Theorem [FKRS 2012]

Up to conjugacy, 55 subgroups of $\mathrm{USp}(4)$ satisfy the Sato-Tate axioms:

$$
\begin{aligned}
\mathrm{U}(1):\quad & C_1, C_2, C_3, C_4, C_6, D_2, D_3, D_4, D_6, T, O,\\
& J(C_1), J(C_2), J(C_3), J(C_4), J(C_6),\\
& J(D_2), J(D_3), J(D_4), J(D_6), J(T), J(O),\\
& C_{2,1}, C_{4,1}, C_{6,1}, D_{2,1}, D_{3,2}, D_{4,1}, D_{4,2}, D_{6,1}, D_{6,2}, O_1\\
\mathrm{SU}(2):\quad & E_1, E_2, E_3, E_4, E_6, J(E_1), J(E_2), J(E_3), J(E_4), J(E_6)\\
\mathrm{U}(1)\times\mathrm{U}(1):\quad & F, F_a, F_c, F_{a,b}, F_{ab}, F_{ac}, F_{ab,c}, F_{a,b,c}\\
\mathrm{U}(1)\times\mathrm{SU}(2):\quad & \mathrm{U}(1)\times\mathrm{SU}(2),\ N(\mathrm{U}(1)\times\mathrm{SU}(2))\\
\mathrm{SU}(2)\times\mathrm{SU}(2):\quad & \mathrm{SU}(2)\times\mathrm{SU}(2),\ N(\mathrm{SU}(2)\times\mathrm{SU}(2))\\
\mathrm{USp}(4):\quad & \mathrm{USp}(4)
\end{aligned}
$$

Of these, exactly 52 arise as ST_A for an abelian surface A (34 over $\mathbb{Q}$).

This theorem says nothing about equidistribution, however this is now known in many special cases [FS 2012, Johansson 2013].
